SUMMARY

Backend engineer and technical lead with 6 years shipping production systems, and a former co-founder and CTO. I take problems from an ambiguous requirement to a deployed system: I set the technical direction, build the hard parts myself, and stay accountable for what happens in production. I've hired and mentored engineers, owned architecture decisions across a team, and dealt with clients directly, including telling them when their idea won't work. Deep in Node.js, TypeScript and NestJS, with recent work in applied AI and multi-agent systems.

SKILLS

Leadership: Technical direction & architecture ownership, hiring & mentoring, client & stakeholder communication, async delivery
Backend: NestJS, Node.js, TypeScript, REST & GraphQL APIs, microservices, event-driven architecture, distributed systems
Applied AI: Multi-agent orchestration (Google ADK), LLM integration, prompt pipelines, schema-constrained generation
Data & Cloud: PostgreSQL (indexing, query optimization), MongoDB, Redis (caching, queues / BullMQ), AWS, Docker, Kubernetes, CI/CD
Also: Rust, Python (familiar), React / Next.js, React Native; fintech, Web3 (EVM & Solana), security tooling

EXPERIENCE

Co-Founder & Lead Engineer

ZenApply (zenapply.app) · Remote · Feb 2026 - Present

- Own every technical decision as the only engineer among three founders, from what to build first to how it runs in production. Took the product from idea to a live platform with paying use.
- Shipped an AI auto-fill engine completing ~100% of supported application platforms and 80-90% of ones nobody built an integration for, by scraping each form's schema and constraining the model to valid answers, over a NestJS/BullMQ pipeline that normalizes messy source data.
- Prototyped a multi-agent system on Google ADK, enforcing quality gates programmatically rather than trusting an LLM reviewer, which is what made the output dependable.

Senior Software Engineer & Technical Lead

BlockApex · Remote · Mar 2023 - Feb 2026

- Technical authority on architecture across client platforms: reviewed designs, settled the hard calls, and mentored junior engineers on distributed-system design.
- Led the backend for a high-concurrency financial platform where a dropped transaction was not an option, using distributed locking and idempotency to keep data consistent under load.
- Made the call to rewrite a Solana security analyzer's core in Rust once regex-based analysis clearly could not resolve macro expansion, cutting false positives to near zero and making the tool trustworthy.
- Replaced ad-hoc deployments with standardized CI/CD across the org's services, removing delivery friction for every team, not just my own.

Co-Founder & CTO

Tezeract · Karachi, PK · Dec 2020 - May 2022

- Built the engineering team from nothing: hired and mentored 4 engineers, set the standards they worked to, and owned engineering strategy for the company.
- Ran client engagements directly, scoping the work, pushing back when requirements did not fit the problem, and staying accountable for delivery.
- Personally architected the company's AI products (Formole, Spintip, Navex, MapApp, Duckends), spanning pose estimation, highlight generation, and gesture and attendance detection. Formole went on to raise venture funding.
- Put computer vision into retail kiosks at Dubai Mall, and architected a payment-reconciliation engine integrating legacy Sabre GDS APIs.

Senior Backend Engineer

Xord (acquired by BlockApex) · Karachi, PK · May 2022 - Mar 2023

- Sole backend architect for a high-throughput media-streaming platform, owning the indexing layer, the reward-distribution engine over large volumes of real-time events, and enterprise OAuth / JWT flows.
- Rewrote a blockchain explorer's PostgreSQL aggregation pipelines after profiling, meaningfully reducing API latency.

Lead Backend Engineer

Xehen · Karachi, PK · May 2020 - Dec 2020

- Led a small backend team and set the API standards and schema designs that carried the platform through early growth.

EDUCATION

M.S. Computer Science, Virtual University of Pakistan (2024-2026)

B.S. Software Engineering, University of Karachi, UBIT (2017-2021)
